Aftercare instructions for adults with additional needs after a general anaesthetic

Introduction

This leaflet is to let you know what to expect when an adult with additional needs wakes up after having dental care under a general anaesthetic.

What can be expected when the patient wakes up?

- Their mouth may feel numb if they have had a tooth taken out by the dentist.
- There may be 'packing' where the tooth has been taken out to help control bleeding. This will either dissolve in a few days or fall out. If it falls out, it will be dark brown in colour and should be put in the bin.
- The patient should not feel too much discomfort, as they will have been given pain killers whilst they are asleep
- You will need to watch the patient to stop them from biting their lip or cheek whilst areas are still numb.
- They should not eat very hot food or drinks whilst their mouth is still numb.
- The patient may need reassurance from you that the 'funny feeling' in their mouth will go away after a couple of hours.

What if the patient has had stitches?

- We will let you know if they have had stitches in their gum.
- The end of any stitches will be cut short to reduce irritation.
- The stitches will dissolve by themselves in a few weeks.
- They may need reassurance from you to manage any short-term discomfort.

When can the patient go home?

There are no strict rules for when adults with additional needs can go home after having a general anaesthetic.

The aim is for the patient to be awake and comfortable. However, the patients individual needs may affect the speed with which they wish to leave the hospital.

We wish to cause as little distress as possible to the patient. Therefore, the patient will be able to leave when you are happy to take them home and you have all the post-operative care instructions.

It is extremely rare that a patient would be required to stay overnight in hospital.

Aftercare following dental extractions

After a tooth is removed a blood clot will form where the tooth was taken out; this blood clot is what heals the socket. It is therefore important that the patient does not disturb the blood clot with their fingers or other objects.

Bleeding

The bleeding will have stopped when the patient leaves the hospital. If the socket starts to bleed/ooze at home, and the patient will allow, you should:

- Get a clean handkerchief or tea towel and roll it up like a sausage
- Place it over the socket
- Ask the patient to bite down firmly for 20 minutes whilst they are sitting up, they must not lie down.

If the patient is unable to do the above, keep them as calm and settled as possible, and ask them to sit upright for 20 minutes to see if the bleeding stops.

If the bleeding does not stop, you must seek dental advice (clinic contact numbers for in hours and out of hours are listed towards the end of this leaflet).

Lukewarm salt water rinse

If the patient is able to use mouthwashes correctly and spit out, a lukewarm salt water rinse can be used the day after the teeth have been removed.

- Add one teaspoon of table salt to half a glass of warm water.
- Ask the patient to hold the salty water in their mouth over the socket for 30 seconds then spit out.
- Do this three times a day for several days afterwards. This will help with the healing process.

If the patient cannot use a mouthwash correctly, encourage them to drink plenty of fluids.

Pain control

Some discomfort, swelling of the gum and bruising can be expected after having a tooth removed.

If the patient is able, they should be helped to follow the guidelines below to reduce problems and help healing:

- Take pain relieving medication such as ibuprofen and paracetamol if their health allows them to normally take them – the dosage on the packet must be followed

- Aspirin should **not** be taken as it may increase bleeding
- No smoking or alcohol for at least 24 hours to reduce the risk of infection and further bleeding
- No active exercise for at least 24 hours
- Avoid toothbrushing in the area where the tooth was removed for the rest of the day. Normal teeth cleaning can be started the next day.

If you are concerned the patient is in a lot of pain or has a swelling after the procedure, you should seek dental advice (clinic contact numbers are listed at the end of this leaflet).

If the patient has a large swelling which is going below the jaw, onto the neck, up to the eye or if any swelling is causing problems with swallowing or breathing, please seek urgent medical attention.

Emergency contact numbers

If you cannot contact your dentist/dental clinic, you should telephone NHS emergency and urgent care services service on 111. You may also go to the Accident & Emergency (A&E) department at your local hospital.

Hospitals with A&E and Oral and Maxillofacial surgery cover are available at:
